

The open, safety-engineered power-conversion platform

Built on our bench-tested dual-MCU control architecture. Swappable power stages scale from 50 kW to the megawatt class for motor drives and DC/DC conversion, with SiC-ready designs.

Size 2 is a 200–450 V-class design rated 465 A continuous and 600 A peak for 60 seconds, with self-commissioning for PMSM and induction motors.

■ Built and bench-tested

Size 2 has completed a **180 V bring-up**, a **one-hour endurance run**, a **20-minute reversal stress test**, and instrument-verified motor self-commissioning. The Size 2 chassis is being tested for use on a **2018 Zero DSR electric motorcycle**.

■ Safety engineered

Six independent paths to the safe state combine hardware shutdown with main-controller and safety-coprocessor authority. The HARA and FMEA map to **ISO 26262** and **IEC 61800-5-2**, with hazards traced to safety requirements and validation.

■ Open everything

Schematics, firmware, **RTE Studio**, safety analyses, assembly data, and interactive telemetry are public at docs.openvvf.org. Sponsors and researchers can inspect what was built and how it performed.

MODULAR POWER BLOCKS

Lower-power custom stages through Size 3

CONTROL MODULE FOC motor control + independent safety coprocessor · USB-B, dual CAN FD, and expansion I/O · RTE Studio + Telemetry Viewer

Size 1

Approximately 50 kW class for light EVs and scalable designs

■ **EARLY DESIGN**

Size 2 Inverter

200–450 V class · 465 A continuous design rating

■ **IMPLEMENTED, UNDER TEST**

Size 2 DC/DC

15 kW · 450 V class · reuses Size 2 boards and power stage

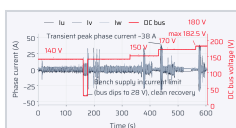

■ **RELEASED DESIGN**

Size 3

Up to 1,200 V · 1,400 A · modular liquid-cooled enclosure

■ **IN DEVELOPMENT**

Live telemetry, not promises

Ten published reports include raw, interactive logs for the browser-based Telemetry Viewer. Approximately 38 A peak current and clean recovery from a supply current-limit event.
